

CAPABILITY STATEMENT

System Capability Overview

- System enables **covert transmission of structured data** using irreversible numerical transformations.
- Data is not encoded as stable symbols but as **transient computational states**.
- Reconstruction is possible only with correct initialization parameters.

Operational Characteristics

- **Without key:**
 - output appears statistically unstructured,
 - no objective correctness test exists,
 - recovery attempts lack convergence criteria.
- **With key:**
 - data is reconstructed with high semantic fidelity,
 - errors are localized (per-block),
 - global structure remains intact.

Resilience Properties

- No stable ciphertext $\rightarrow$ no algebraic attack surface.
- No correctness oracle $\rightarrow$ no adaptive attacks.
- No key identifiability $\rightarrow$ no effective brute-force enumeration.

Limitations

- System does not provide formal security proofs.
- Automated verification of correctness is not guaranteed.
- Performance depends on numerical environment characteristics.

Assessment

System provides practical information concealment by operating outside conventional cryptographic and information-theoretic models, complicating analysis and attack formulation.

If the adversary cannot define success, they cannot optimize an attack.
